MUC5AC is a major component of mucus glycoprotein secreted by goblet cells lining the airway surface. Recently, we designed a nanogel platform based on a poly-N-isopropylacrylamide (PNIPAAm) shell and a chitosan core (CAH NPs). CAH NPs, which display positive electric charges, were demonstrated to interact with bacteria and virus, thereby playing a major role in microbial clearance. Accordingly, such nanoparticle was named anti-bacteria-and-virus nanogel. By incorporating a cellulose-based hydrophilic polymer, CAH NPs formed a novel hydrogel capable of self-assembling into a spherical shape in aqueous conditions, named agarose CAH NPs (CAH NPs/agarose). This study aimed at investigating the ability of CAH NPs to recognize the mucus glycoprotein, MUC5AC, thereby mimicking the epithelial environment. CAH NPs/agarose was found to interact with MUC5AC, to form a CAH NPs/agarose-MUC5AC complex in which the nanogel core was wrapped by the mucin. Analysis of the data by quartz crystal microbalance with dissipation (QCM-D) showed that formation of this complex occurred fast and was accompanied by CAH NPs dissolution. By monitoring these physicochemical events, the NPs/agarose-MUC5AC interaction kinetics was studied in detail. In this study,
