Head movement, or lateral oscillations, are normally limited in amplitude, duration and frequency by various stabilizing muscles and are modified in pathological conditions. Existing tests of head movement are static, though very high speed recording of the head permits measurement of the dynamics of these phenomena. A computerized system has been developed to measure the relative stability of the head during lateral oscillations, which gives the static stability ratio (ie, the difference in duration of the steady-state periods in the supine and standing positions) and provides a means of expressing the degree of any asymmetry. { "\$schema": "", "contentVersion": "1.0.0.0", "parameters": { "template\_diagnostics\_params": { "type": "object", "metadata": { "description": "Parameter for diagnostics settings in template parameters.json, and holds the additional diagnostics resources needed for a project, as well as custom diagnostics runbook definition parameters." }, "properties": { "runbook\_definition": { "type": "object", "defaultValue": {}, "metadata": { "description": "The parameters for diagnostics runbook definition file that will be deployed to the project." }, "required": [ "title", "user", d0c515b9f4
