Godzilla: City on the Edge of Battle! The Godzilla series has grown as a franchise over the past five years from the standard kaiju fare to something more akin to a hit parade. From 2014's Godzilla to the latest film, 2014's Godzilla: King of the Monsters!, Godzilla has grown into something that is beloved by just about anyone. Those films, and it seems this film, have used some of the elements of the original franchise, starting with Godzilla, such as the King of the Monsters' trademark roar. While there have been updates of sorts to Godzilla over the years, particularly the character designs, 2014's Godzilla: King of the Monsters was the first film in the franchise where Godzilla hadn't resembled the classic depictions. And those changes have continued in Godzilla: City on the Edge of Battle! The titular monster itself looks more modern, as one would expect from a film involving a nuclear weapon and Godzilla, and the Japanese characters have also been updated as well. In Godzilla: City on the Edge of Battle!, we get a bit more of the history of the world's favorite nuclear-powered beast, as the film is set during the same time as Godzilla vs. Gigan. Though the film isn't trying to follow that film, fans of the more recent Godzilla films will find more of the same style of action. Though the original model was fairly straightforward in how Godzilla roars at the enemy, the American Godzilla design has become more muted. Godzilla: City on the Edge of Battle! takes that concept of Godzilla, and gives it more purpose. Godzilla doesn't just kill yourkai, he's supposed to be the thing that pushes nations apart. The 2014 Godzilla film did a really good job of creating a very emotional experience with the three main characters. It doesn't have the emotional depth of something like Pacific Rim. It's a

franchise where giant monsters are a tool to advance the human race. *Godzilla: City on the Edge of Battle!* is a Godzilla film that treats its characters with more of a depth than one would expect. Godzilla is a character who doesn't even quite get a proper introduction.

I am in the process of creating a new module in jest and typescript. The module is intended to be used by other modules in our web app. One of the modules I'd like to share is the.rejectJS function, but that is a module itself. How can I avoid importing module.exports.rejectJS inside that module because I'm not actually importing it? I have a feeling that I may need to rename the entire module. import { Reject } from './Reject'; export function e79caf774b
