TS-999 Crack For PC Latest

RECYCLED COMPONENTS Every single component on the signal path of the original analog circuit has been taken into account in the modeling process, in order to obtain an accurate model of the original board. We guarantee that the musical DNA of the original has not been affected. Note that the TIP51 transistor used in the original circuit has been replaced by a Darlington-pair transistor to reduce noise and improve the signal quality. **CESIUM CIRCUIT** An entirely new Circuit Design, enabling a powerful new sound, making it noticeably more aggressive than its green counterpart. **MIXER SECTION** The TS-999 offer 7 knobs, dedicated to each of the different aspects of the signal path. The pedals section includes 3 knobs controlled by an LCD Digital Stereo Meter, and a programmable wet/dry knob, with the settings saved in the device and recalled at any time. The preamp section includes 3 powerful knobs, for the tube stack, and 1 low-gain tube and 1 PWM control knobs for the power supply section. There is also an input and output level control. The section dedicated to the "WARP" also includes 1 control knob for the automatic level control, as well as a 3-band Filter switching selector for "Raw", "Clean" and "Muddy". The amount of programmability of the TS-999 makes it easy to match its output to any pre-existing setups, or even to create entirely new ones. **DRIVE SECTION** The TS-999 is set up to work in all 2/3/5-Ohm configurations, switching to the optimal impedance for each single channel. There is also a volume control for the bypass section, and the TS-999 has been created to reproduce exactly the original tones of the overdrive circuit. The "dirty" tone is reproduced using the 1st sub-circuit, while the "clean" tone is reproduced using the 2nd sub-circuit. **DIFFERENTIAL SECTION** The TS-999 offers a unique input structure, designed to reproduce the overdrive effect of the original hardware. There are 4 different inputs, each one of them working with a dedicated preamp circuit. The front-end of the circuit is comprised of a unique High-Pass Filter for each channel, which is followed by a 6-Band EQ, for equalization of the input signal. There

The SubScreamer was created from its original analogue circuit. Among the eleven band-pass filter section, five octave-up splitters, the super-fast 555 chip oscillator and the big 2,500mA power supply, it is the five band EQ that makes the difference. An FET is used to step down the power supply on to both positive and negative rails. The actual gain reduction is done by a 560R Darlington pair, though this has been optimised for maximum distortion, but it won't hurt your guitar as the gain reduction is only 90dB in total. For the best possible emulation of the real hardware, the most used effects has been taken into account: Each band has its own gain, bandwidth and amplification. You can also cycle through them with the push of a single button. The interaction between the different bandpass-filters, the down-samplers and the pre- and post-graphics has been adjusted by using five separate transformers, each with its own feedback. Together with the two send / return inputs, a complex interconnection is built, mimicking the real SubScreamer's connection patterns and impedance. The TS-999 consists of three buffered inputs. There is a gain switch and a master volume that affects all the three inputs at once. This also allows easy and safe integration with other amps. The final output uses a high-quality XTR transformer for a balanced output signal. Even the circuit board layout has been meticulously copied from the original SubScreamer. The TS-999 integrates all the previous knowledge about the "808" and "Lunar-1" and keeps them in one handy box. If you own any of the SubHumans pedals and want to finally own a truly analogue emulation of those legendary and rare overdrives, download the free demo and try it out now! Supernova 9-band Dynamic Pedal is the most popular, established and trusted guitar overdrive for the most demanding players.
